In the framework of Political Geography of Water, this book examines the logics of water policies implementation in the Central Asian region. Reflecting on the relations between political power, water policies and the hydraulic territories, it analyzes the Integrated Water Resources Management (IWRM) implementation - the global water paradigm promoted by the development organizations since the 1990s - its logics and rationales, in Uzbekistan and Kazakhstan at the basin / local level. Based on detailed, actor-oriented and comparative field-

research in two river basins, the main findings highlight how the IWRM implementation was reconfigured by the two states in order to pursue specific socio-political strategies, in contradiction with the paradigm's aims and the narratives of international development.

Coal is a valuable resource. It provides a significant amount of the World's energy supply and it is the basis for many industries. However, in areas where coal lies close to the Earth's surface and has been exploited by open cast techniques, radical alterations of landscape and significant impacts on the environment have occurred. This report was prepared to provide guidance to those who are responsible for the prevention of environmental effects from surface mining and for the restoration of the mining areas. Environmental problems of surface coal mining and restoration of the mine sites are

discussed in the report. Particular attention is given to Eastern Europe, which continues to be a major centre of opencast lignite mining. Reclamation of mined lands for forestry, agriculture and wildlife is briefly discussed. However, the sheer volume of coal removed from many mines in Eastern Europe is so vast, that there is often insufficient overburden material to refill the pits. Consequently, the main focus of this report is on the creation of lakes in these former surface mines. Many problems have to be overcome in creating healthy lakes for recreation or wildlife. Guidelines for treating water quality problems and further development of lakes are provided. Techniques for dealing with acidic waters, eutrophication and contamination are discussed.
